

Railway CLI One-Click Kit - Guide

Beginner Guide — Railway CLI One-Click Kit

Written so that even first-time users of computers, the internet, or AI tools can follow along, describing **exactly what you see on screen**. Hard terms are explained in parentheses.

Railway = a service that runs your app / server / database **on the internet** and gives it a URL. (e.g. chatbot, backend, API)

📄 PDF with identical content: `GUIDE.en.pdf` · KR Korean: `사용설명서.md` / `사용설명서.pdf` 📘 Full reference: `README.en.md` / `README.en.pdf`

0. Before you start (just one thing)

Double-click `시작하기.bat` (means “Start Here”) in the folder. In blue text it shows your **PC state** and a one-line “**what to do now.**” Just follow that.

- A black (or blue) window is normal.
- Choose with **Up/Down arrows + Enter**, or press **number keys**.
- **No administrator (UAC) prompt appears.** This kit needs no admin rights. (If some other admin prompt appears, it’s unrelated to this kit.)

0-1. If a file won’t open or you see a “protected” warning (unblock downloads)

Windows sometimes **locks** files downloaded from the internet for safety. Just unblock them.

- **Way 1 (easiest):** **Before** extracting, right-click the zip → **Properties** → **check “Unblock” at the bottom** → **OK**, then extract.

- **Way 2:** Right-click 시작하기.bat → **Properties** → check **“Unblock”** → **OK**, then double-click.
- If a blue **“Windows protected your PC”** dialog appears → **More info** → **Run anyway**.

Once 시작하기.bat runs once, the rest of the files are **unblocked automatically** (usually you only deal with this the first time).

1. Install (once)

1. 시작하기.bat → choose **[1] Install / Update**.
2. A **black window** runs in English automatically. **Don't close it; wait** (usually 1–10 min).
 -  **No admin prompt appears**. Just wait.
3. Success when you see **INSTALLATION COMPLETE** (or a similar message).
4. Return to the panel and press **any key** — it re-checks your state.

If it says “Node.js is missing”? → The kit still **tries another method (downloading the program binary) automatically**. If that also fails, get it yourself: 1. Open <https://nodejs.org> in a browser 2. Download the big green **LTS** button (version 20+ recommended) and install 3. Close the window, **rerun** 시작하기.bat, then **[1] Install / Update**

If it says “railway not found” right after install → press **[9] Health check** → **[2] Refresh PATH**, or close all windows and reopen 시작하기.bat.

2. Login (connect your Railway account, once)

1. 시작하기.bat → choose **[2] Login**.
2. A browser opens automatically → **log in / Authorize with your Railway account**.
 - No account? Sign up free at <https://railway.com> first.
3. When you see “success”, close the browser and return to the panel.

- Login is one-time; it remembers you afterward.
- Verify: **[3] Check login status**.

- See your projects: [4] **View my projects**.

3. Common tasks menu (deploy · logs · status)

From home, press [5] **Common tasks** to open an **easy Korean menu** instead of the hard 30-item English one.

No.	What it does
1	Init project — create a new project for this folder
2	Link project — link to an existing project
3	Deploy — publish this folder to the internet (<i>YES confirm</i>)
4	Redeploy — re-publish the latest (<i>YES confirm</i>)
5	View live logs — server logs (stop: Ctrl+C)
6	Project status — current status
7	View variables — list of settings
8	Open all 30 functions — advanced menu (new window)
0	Back (home)

4. Prepare → Deploy (order matters!)

Order: **Login** → **Init/Link project** → **Deploy**

1. Best to start inside the folder that holds your app (code) files.
2. 시작하기.bat → [5] **Common tasks** → [1] **Init project** (or [2] **Link** if it already exists).
 - If English questions appear, choose with **arrow keys (↑ ↓)** and **Enter**.
3. [5] → [3] **Deploy**.
4. When it says “**type uppercase YES to publish**” → type **YES** and Enter. (Plain Enter cancels.)
5. Verify with [5] → [5] **View live logs**.

Deploy = running your app **on Railway's servers**. It becomes public, so do it **inside your app folder, after linking/initializing a project**.

5. When stuck — Health check (self-diagnosis)

시작하기.bat → [9] Health check / troubleshoot.

On one screen it auto-checks **Node.js · Railway · install location · login · internet** and tells you **what's wrong and what to press**.

Quick-fix buttons: - [1] Reinstall / update - [2] Refresh PATH — instant fix *when you just installed but it shows "missing"* - [3] Re-check - [0] Back

6. Remove (uninstall)

- 1. 시작하기.bat → [6] Remove.
- 2. Review what will be deleted, then type uppercase **DELETE** to proceed.
- 3. It removes cleanly.

Don't worry — removal keeps: - Your **app (code) files** - **Node.js** - Your **apps already on Railway's servers**

Only the program is removed. The hidden link info (**.railway**) in your project folder is intentionally kept to prevent mistakes.

7. When an error appears (don't panic)

Screen	Do this
"Windows protected your PC / blocked"	Right-click → Properties → Unblock → OK. Or More info → Run anyway
RAILWAY CLI IS NOT INSTALLED	First 시작하기.bat → [1] Install / Update

Screen	Do this
Installed but <code>railway ... not found</code>	[9] → [2] Refresh PATH , or close and reopen in a new window
Node.js warning	Leave it; it tries another way. Else install LTS from https://nodejs.org and rerun [1]
<code>install did not finish</code> -like message	[9] → Internet check. Turn off antivirus for 10 min and retry
Deploy fails	Run [5]→[1] Init or [2] Link in your app folder first
Wrong number in a menu	It just returns to the menu. No harm
Korean panel won't open	Double-click <code>INSTALL.bat</code> → <code>RUN.bat</code> → <code>UNINSTALL.bat</code> (English)

8. FAQ

Q. Must I memorize commands? A. No. Just press arrows or numbers. (Advanced users can type commands directly via the full menu (RUN.bat) **30. Run custom command.**)

Q. Do I need administrator rights? A. No. **No admin prompt appears.** The program installs only into your user folder.

Q. Does it cost money? A. Railway uses usage-based pricing / free credits. Heavy usage may incur charges — check your <https://railway.com> dashboard. (This kit itself has no cost.)

Q. What if I press the wrong thing? A. Dangerous actions (deploy, take down, remove) all require typing **YES** or **DELETE** first. You can also just close the window.

Q. Where are my files / logs / config? A. Login info `%USERPROFILE%\railway\config.json`, install log `%TEMP%\railway_install.log`. (See `README.en.md` section 13 for full locations.)

For the full reference, command table, and license, see `README.en.md`.
